

## Upstream Pressure Regulating Valves - Series 700

These are self operated upstream pressure regulating control valves, used in many applications for limiting pressure buildup (i.e. prevent overpressure) at its location in the pressure system.

The valve opens in proportion to the inlet pressure preventing a rise of

internal pressure in excess of a specified value.

These valves are used on a wide range of applications in the chemical process industry for up-stream pressure control, eg: Refineries, Fertiliser and Petrochemical Plants, Pharmaceutical and Food Processing Plants.

### Specification

<b>Design Code</b>	ASME B16-34
<b>Valve Size</b>	15 to 150 mm (1/2" to 6")
<b>Valve Type</b>	Direct or Pilot Operated
<b>Rating</b>	ANSI 150 and 300, Higher on request
<b>End Connection</b>	Flanged – 15mm to 150mm (1/2" to 6") Screwed – 15mm to 50mm (1/2" to 2")
<b>Body Material</b>	Carbon steel, Chrome-moly steel, Stainless steel, Monel, Alloy 20, Hastelloy B/C, Duplex stainless steel, Aluminium bronze

<b>Trim Material</b>	Stainless steel, Duplex stainless steel, 13% Chrome steel, Monel Hastelloy B/C, Stellite
<b>Diaphragm</b>	Neoprene, Natural rubber, Nitrile, EDPM, Viton, Teflon.
<b>Max. Temperature</b>	As per the diaphragm limitations.
<b>Seat Leakage</b>	As per FCI-70-2 Class IV, V and VI

### Design Features

- Glandless Construction: Where positive Zero gland packing is required, the design scores over conventional solutions such as bellow seals etc. as the gland itself is eliminated.
- Wide range of body sizes and trim sizes to satisfy varied flow requirements.
- Tight sensitivity and stability of controlled pressure.
- Provides excellent tight shut off capability over long working life.
- Compact design with minimum number of moving parts.
- Simple resetting.

### Quality and Performance Guarantee

- Produced with Quality Systems accredited to ISO 9001 : 2008
- Full material certification available for all major component Parts.
- Full guarantee on design and performance.
- All testing performed to the requirements of ANSI B16.34.

### Regulator Vs. Control Valve / Instrument

#### Selected Regulator Characteristics

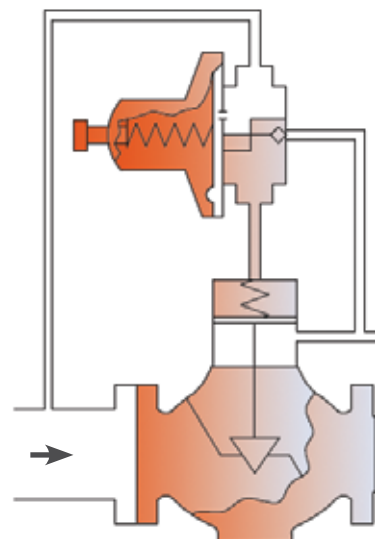

- Purchase price, installation and maintenance costs are normally lower.
- Requires no additional power sources for basic operation
- Less complex, and often lighter and more compact.
- Controller, which provides fixed-band proportional control only, is built in.

#### Selected Control Valve / Instrument Characteristics

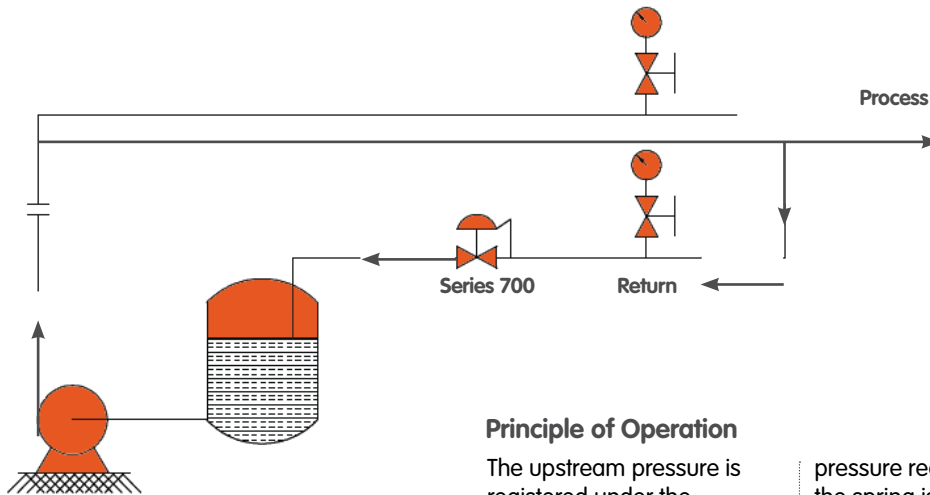

- Wide variety of construction material and accessories available. Transmitting and controlling instruments are separate and may be remote mounted.
- Specific construction has broad application flexibility.
- Separate controller allows for adjustable-band proportional control with reset and/or rate optional for excellent control response.

Direct Operated

Pilot Operated

A Typical Application

**Principle of Operation**

The upstream pressure is registered under the diaphragm opposing the spring when the upstream

pressure reaches the set point, the spring is compressed allowing the valve plug to open and relieve excess.

Flange End connection up to 1"

Flange End connection up to 1.1/2" and above
